

## Psychotria Colorata aka Humo trip report.

Start: I drank two 0.75 gram capsules of Humo for a total of 1.5 grams.

~1 - 15 minutes: The Humo has come on much faster and stronger than expected. A very rapid onset of dissociative and opiate effects.

~17 - 45 minutes: Humo is a distinct and quite strong opioid, physical & mental euphoria on par with 4 - 8 grams of red Kratom. Cognitive/ physical disconnection is apparent, feeling a distance away from my thoughts & body. Detachment has risen to the 2nd plateau (detachment plateaus not to be confused with DXM plateaus), feeling tactile numbness alongside minorly blurred vision.

~1 - 1.5 hours: The Humo peaked around this time. I feel like a bolder sinking in the ocean. Opioid euphoria is quite strong which masks the dissociative effects to a large degree. Experiencing mild geometrical patterns of dim blues, greens, oranges, and purples. Holes, spaces, and voids were experienced up to level 2 with possible level 3.

3 - 5 hours: Open eye visuals are also experienced with environmental orbism being dominant. The whole visual field becomes made up of many small orbs that have their own gravity warping the visual field. During this time I drank a number of 5% beers with noticeably increased the physical euphoria. I also took a few hits of nitrous oxide which caused a rapid and short increase of the visual effects.

6 - 8 hours: During this time the experience ramped down back to near baseline. Drifting off to bed the spaces voids and holes increased to strong level 3.
